Start with Wellness to Master Other Goals

To achieve an exciting work goal, boost motivation, and take consistent action, start with a personal health goal you have been putting off. There is a psychological link between the two. Tackling a long-delayed wellness goal creates a sense of accomplishment. This win brings positive momentum, certainty, and higher self-esteem that will energize you. Make it a goal you can repeat, such as walking regularly or eating healthier. Following through builds confidence and proves you can commit to any goal. This success increases your excitement. It strengthens your belief in your ability to succeed. It also builds discipline, a key to achievement. By improving your health and physical resilience, you will discover that mental fatigue is more easily managed. Try this path and you'll discover you have more focus and energy needed to achieve any goal you have in mind.

Try a Three-Minute Wake-Up Workout

Nodding off at work? Before reaching for caffeine, try three or four minutes of light muscle work to wake up your body and sharpen your attention. Use a book, small hand weights, or your own body weight for resistance. Hold books or weights securely, then do slow arm curls or overhead presses with a comfortable amount of resistance. Move slowly, breathe normally, and stop if you feel pain, dizziness, or unusual shortness of breath. You may feel warmer, more alert, and ready to return to your task. Because it takes so little time, you may find yourself repeating it and turning a quick energy boost into a new health habit. (Always consult your doctor before starting a new exercise program to ensure it is safe for any conditions you may have.)

Dangers of Doctorless Health Care

If you turn to the internet, particularly AI, to diagnose or treat medical conditions, reconsider that, if it means going without a doctor. AI can provide outdated, incomplete, or incorrect information—and its disclaimer says so. Answers aren't medical advice, even when they seem to fit your situation perfectly. Relying on AI to manage health issues can delay treatment for serious, rare, or difficult-to-treat or progressive conditions, particularly as you grow older. AI can't examine you, take vital signs, observe symptoms, or order tests. Your doctor doesn't give you a disclaimer that their advice could be wrong. Doctors are accountable for clinical decisions, monitor whether treatment is working, and make adjustments as needed. Use AI only as an educational aid, not as a diagnosis, prescription, or substitute for medical care. Here's an idea: Be a good healthcare consumer. You can bring a copy of the questions raised by AI to your doctor for a discussion. Never delay seeking treatment for symptoms that are severe or getting worse.

Neurodiversity Coaching Might Be for You

Could coaching help you feel more confident and effective at home or at work? It might if expectations, noise, lights, or communication with your family, friends or coworkers leave you confused and struggling. Asking for help isn't weakness. It can help you understand how you work best and succeed with others on the job. Neurodiversity coaching is a growing specialty. An estimated 15%–20% of people are neurodivergent. Their brains process information differently, which may affect how they learn, communicate, focus, or respond to their surroundings. Coaching offers practical help with goals, routines, communication, community, and workplace issues. Coaches offer guidance on time management, preparing for meetings, communicating clearly, and staying on task at work. Coaching can help you be less self-consciousness about differences and be more comfortable asking for support.

Election Stress: Staying Informed Without Staying Upset

Election coverage can be distracting and distressing, and coverage is ramping up right now. Media companies' competition for your attention ensures lots of triggering commentary and stories that can increase anxiety, irritability, and dissension among family and friends.

Awareness and deciding you won't be victimized by it can keep you from being overtaken by it all. Here are some time-tested tips on political media triggering: 1) Choose a set time to check in and get any updated news. 2) Choose reliable news sources, realizing none are purely unbiased. 3) Switch to print- or text-only news so you reduce the emotional messaging mixed with news. 4) Put up digital roadblocks by using content filters and app settings to scrub election noise completely out of your feeds and off your devices. 5) Notice physical signs that you have reached your limit, such as muscle tension, rapid breathing, or difficulty concentrating. Take a walk, contact someone supportive, or focus on an activity you can control. You do not need to absorb every opinion to participate responsibly. If election stress begins disrupting sleep, relationships, or job performance, consider confidential assistance from a health provider. Learn more: jedfoundation.org/political-anxiety/

Keep Your Hard Day from Coming Home

A hard day doesn't have to follow you home. That argument with a coworker, family member, a tense meeting, or a new deadline that feels impossible, can make your loved ones an audience for your frustration. Worklife balance isn't just about dividing time between work and home, it is also about managing emotions, letting go of the day, and becoming emotionally available to loved ones. This isn't necessarily easy. You have to be intentional, and it takes practice. During the day, take a few intentional minutes to pause, breathe slowly, release tension, and shift your attention toward home. Practice this exercise daily, even when you do not perceive stress, because tension can linger outside of your awareness. And regular practice can condition your brain to let go faster, making the transition easier. If you continue to struggle with leaving it all behind, a healthcare provider like a therapist or coach can help. Don't hesitate to contact them. They'll help you identify other strategies to make the transition at home easier.

Providing individual, couple, and family coaching and organizational consulting on pre-retirement and in-retirement non-financial planning.

When a Grieving Coworker Returns to the Job

When a coworker returns after the death of a loved one, you may worry about saying the wrong thing. You needn't find the perfect words. A simple "I'm sorry for your loss" is enough.

Some employees hold back, fearing they may cause greater distress. Don't hesitate to acknowledge the loss. Your coworker may be counting on it because it shows their loss matters and they needn't carry their grief alone at work or pretend they're "feeling fine." Acknowledging grief helps people feel seen and supported when their lives are upside down. Feeling less alone can also open the door for a grieving coworker to ask for support later, when they need it most. You can't make their grief disappear, of course, but your sincere condolences can ease their isolation and help them feel supported as they find their way forward. Learn more:

Growth vs Fixed: More Than Just About the Money

A growth mindset is the belief that abilities and skills can develop through effort, practice, and support. A **fixed mindset** is the belief that our abilities are largely set, so challenges or mistakes may feel like proof that we can't succeed. Overall, change management and change resiliency are critical life skills at any age. In retirement, or one's Next Chapter, these outlooks can shape how people respond to the challenges of change and use their time. Someone with a growth mindset may be more willing to learn technology, be curious, explore hobbies, build friendships, or adjust to a new routine. They may see setbacks—such as struggling with a new activity or new relationship — as part of learning rather than a reason to stop. This can support confidence, adaptability, engagement, and thriving in the face of challenges. A fixed mindset may lead someone to avoid unfamiliar activities for fear of failure or to assume it's "too late" to learn. That can narrow opportunities for enjoyment, connection, and personal growth. Neither mindset defines a person permanently. Pre-retirees and those in retirement can practice a growth mindset by starting with manageable goals, noticing progress, asking for help (i.e., coaching), and treating mistakes as useful feedback. This next phase of life can be a chance to keep engaged in continuous adult learning and shape a meaningful next chapter.
